

Lab Set-up instructions (for Macs):

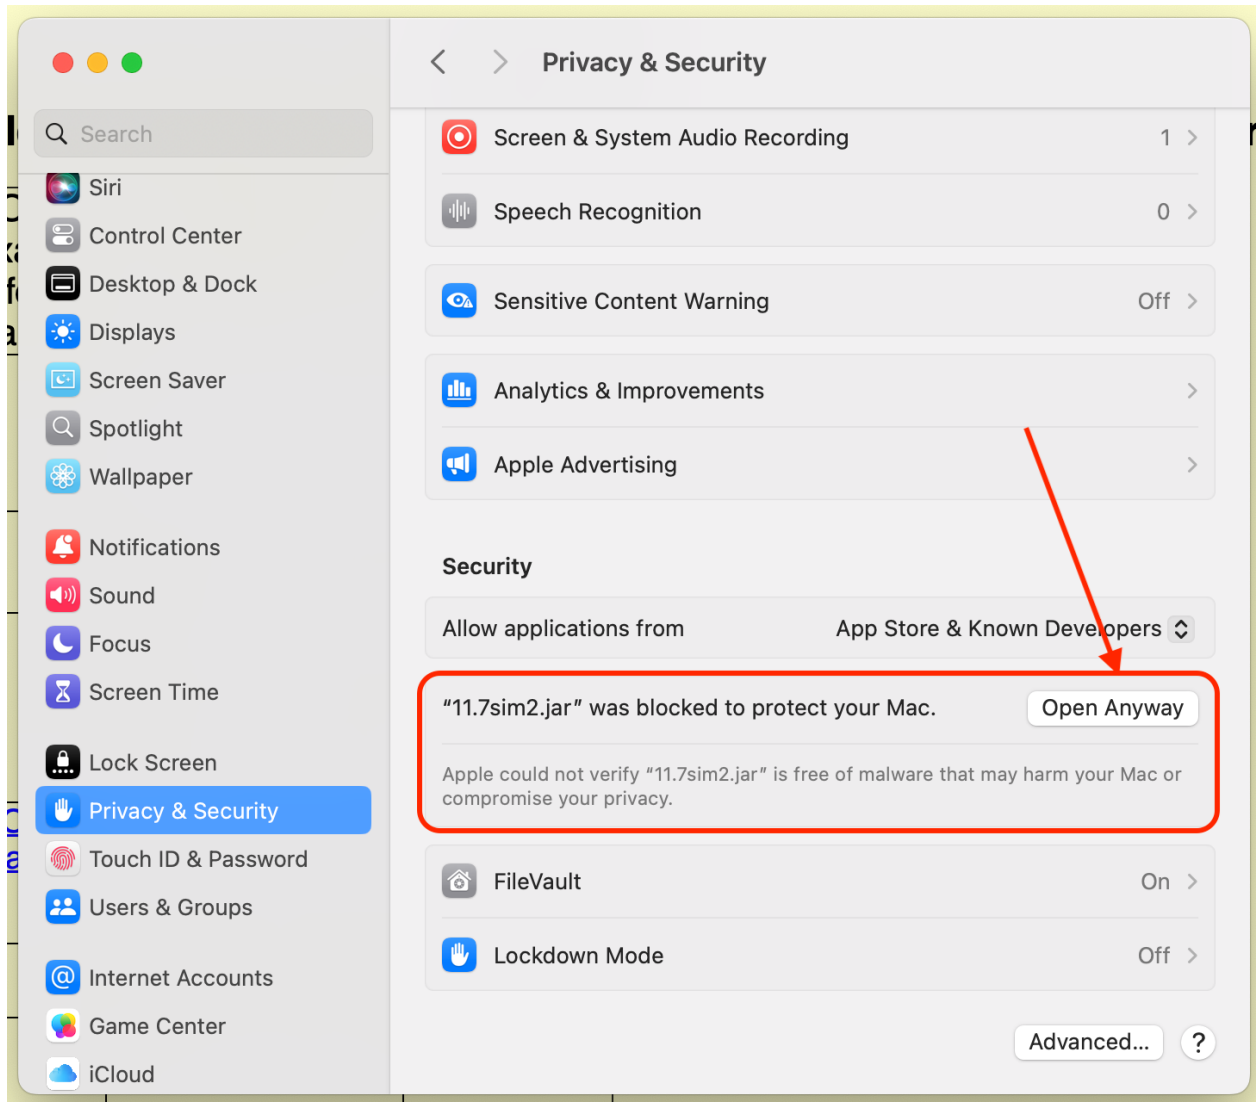

- 1) All Macs likely already have Java installed.
- 2) Go to <http://minirov.info/ph213/> and download the desired lab sim. Go ahead and download both Lab Sim 1 and Lab Sim 2. They are found in Week 3 under Lec 3.
- 3) If you try to open the file immediately, this pops up. Simply click “Done” and **NOT** “Move to Trash.”

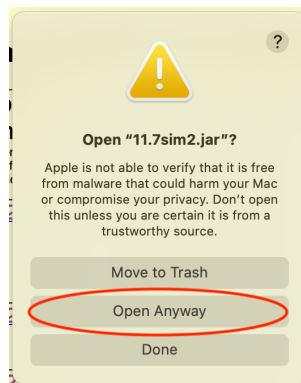

- 4) You need to allow your computer to open it because it automatically sees this as malware. Trust me, this is not malware, but typically .jar files are used for malware purposes. Go to “System Settings” → “Privacy & Security”

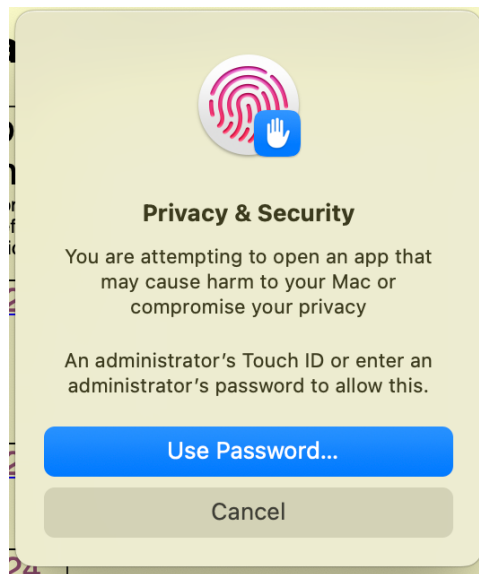

- 5) Once in “Privacy & Security,” scroll all the way down to the bottom on the right hand side. Near the bottom, you should see something like, ‘ “11.7sim1.jar” was blocked to protect your Mac.’ Go ahead and click “Open Anyway.”

- 6) You'll get one more warning that looks like the image below. Click “Open Anyway” again.

- 7) You'll also get a request for an administrator's password. Go ahead and "Use Password..."

- 8) After all this, the sim will open. Repeat the process for Lab Sim 2.
